2000 CCR Award Winner

Collaboration Success!

Receiving the award from the Council for Chemical Research (CCR) were research teams from American Superconductor; Argonne, Los Alamos, and Oak Ridge National Laboratories; and the University of Wisconsin at Madison.

The Wire Development Group

The Group's Research Led To Commercialization Of High-Temperature Superconducting Wire

American Superconductor's tests show that three strands of its multi-filamentary superconducting wire can transmit as much electrical current as a conventional copper cable although almost 100 times smaller in cross section.

Superconducting-wire coils designed and fabricated at American Superconductor's Westborough, MA, facility were used in this 1,000 hp motor manufactured by Reliance Electric.

The Group's materials research led to commercialization of a robust, flexible superconducting wire that is suitable for numerous electric power applications, such as the 1,000 hp motor (upper right) being assembled by technicians at Reliance Electric.
